

Bugs: Small But Important in Our World

Bugs come in all shapes and sizes.

Some bugs, like bees, have wings. They use their wings to fly from flower to flower.

Other bugs, like beetles and roly-polies, move around on the ground with their many legs.

Spiders make webs to catch other bugs for food. They make a strong and sticky thread to make a web.

Bugs stick to the thread. The web is really a bug-catching trap!

Bugs are interesting but they are also important.

As bees fly from flower to flower, they move pollen. Pollen helps plants grow.

Bugs, like ladybugs, eat other bugs that can harm plants.

The spider's bug-catching trap may seem scary. But they catch flies, which can carry germs that make us sick.

The many kinds of bugs in our world can help in keeping our world healthy.
